

IN THE CLAIMS

Please amend the claims as follows:

1-20 (Cancelled)

21. (New) A method of providing a pre-metered combined dose of finely divided dry medication powders, comprising:

preparing a pre-metered dry powder medicinal combined dose comprising at least two medicaments of separate dry powder formulations, whereby a pre-metered powder quantity per substance is deposited onto a common dose bed, where the sum of the depositions constitute the pre-metered quantity of powder in the medicinal combined dose, and the deposits of the at least two medicaments are optionally kept separated from each other on the common dose bed such that the at least two medicaments cannot detrimentally interact after forming of the combined dose; and

sealing the combined dose from ingress of moisture,

wherein the medicinal combined dose is adapted for delivery from a dry powder inhaler device during the course of a single inhalation, whereby the delivered medicinal combined dose is composed at least partly of de-aggregated fine particles of each of the at least two medicaments.

22. (New) The method according to claim 21, further comprising:

selecting a continuous dry powder inhaler (DPI) designed for a prolonged delivery of the medicinal combined dose to a user inhaling once through the DPI, the prolonged delivery taking place in 0.01 to 6 s.

23. (New) The method according to claim 21, further comprising:

selecting a dry powder inhaler (DPI) designed for a single delivery of a combined dose.

24. (New) The method according to claim 21, further comprising:

selecting a continuous dry powder inhaler (DPI) designed for sequential delivery of two or more medicinal combined doses during the single inhalation initiated by a user.

25. (New) The method according to claim 21, further comprising:

preparing the pre-metered dry powder medicinal combined dose by depositing the at least two medicaments onto the common dose bed to form a medicinal combined dose having a general elongated shape.

26. (New) The method according to claim 21, further comprising:

preparing the pre-metered dry powder medicinal combined dose by depositing each of the at least two medicaments in a respective separate compartment in the common dose bed.

27. (New) The method according to claim 21, further comprising:

preparing the pre-metered dry powder medicinal combined dose by depositing each of the at least two medicaments in the common dose bed and depositing a biologically acceptable, inert substance between the at least two medicaments to prevent the at least two medicaments from detrimentally interact after forming of the combined dose.

28. (New) The method according to claim 21, wherein the medicinal combined dose is adapted for delivery from a dry powder inhaler device during the course of a single inhalation by gradual aerosolization of the combined dose in the form of a relative motion between an air-sucking nozzle and the common dose bed.

29. (New) The method according to claim 21, further comprising:

utilizing at least one of the at least two medicaments in a form of a dry powder compound mixed with a suitable excipient.

30. (New) The method according to claim 21, further comprising:

forming a dose bed as a blister pack designated to accept deposits of the medicaments making up the metered combined dose.

31. (New) A medical product comprising a pre-metered combined dose of finely divided dry medication powders, wherein

the metered combined dose comprises pre-metered quantities of at least two medicaments, separately deposited on a common dose bed and optionally kept separated from each other on the common dose bed such that the at least two medicaments cannot detrimentally interact;

a seal protecting the combined dose from ingress of moisture;
the medicinal combined dose being adapted for a user initiated delivery of the combined dose during the course of a single inhalation through a dry powder inhaler device;
the deposits of at least two medicaments of the medicinal combined dose being arranged to be aerosolized during a single inhalation, whereby a delivered combined dose to a user comprises fine particles of each medicament.

32. (New) The medical product according to claim 31, wherein at least one of the at least two medicaments is in a form of a dry powder compound mixed with a suitable excipient.

33. (New) The medical product according to claim 31, wherein the deposits of at least two medicaments of the medicinal combined dose are arranged to be aerosolized during a single prolonged delivery taking place in 0.01 to 6 s.

34. (New) The medical product according to claim 31, wherein the deposits of the at least two medicaments have a general elongated shape.

35. (New) The medical product according to claim 31, wherein each of the at least two medicaments is deposited in a respective separate compartment in the common dose bed.

36. (New) The medical product according to claim 31, wherein a biologically acceptable, inert substance is deposited between the deposits of the at least two medicaments to prevent the at least two medicaments from detrimentally interact after forming of the combined dose.

37. (New) The medical product according to claim 31, wherein the combined dose bed is formed as a blister pack, where the combined dose bed is designed to accept deposits of the at least two medicaments making up the metered medicinal combined dose.

38. (New) The medical product according to claim 31, wherein the pre-metered quantities of the at least two medicaments are kept separated from each other on the common dose bed such that the at least two medicaments cannot detrimentally interact.
